VG7 LOGISTICS

Update and monitor the status of your warehouse and shipments directly from the VG7 platform

If you have the production routing module, you can organize your warehouse directly from the VG7 platform.

In particular, you have the ability to enter and update the stocks of individual materials, monitor low-end material, create purchase

orders from the raw material supplier and set end-of-stock alerts.

Furthermore, VG7 is designed for interfacing with shipping management systems.

Warehouse loading / unloading

This feature allows you to load / unload the warehouse quickly and easily, both manually and automatically.

In particular, it allows you to: view and correct the stock unloading during the processing cycle, carry out loads from supplier orders, and handle the material via barcode.

Low stock alert and automatic ordering

With this feature, the system checks the availability of the material while the offer is being created and warns you with an alert if the material is below a previously defined threshold.

Raw material supplier management

This feature allows you to manage different suppliers for each single material. For example, it is possible to configure multiple materials, each with its own purchase price, for each grammage of each paper in the various press sheets or for the single plate or reel of each rigid or flexible material.

Split shipments

This feature allows the customer to enter multiple shipping addresses for the same order line, choosing the quantity to be sent to each destination and the shipping method. For example, if the customer has purchased 500 business cards, they can choose to ship 200 to one location and pick up the remaining 300 at your location.

Improve the entire warehouse flow, from the order to the supplier to the delivery note

This feature allows you to create subcontracting orders starting from the customer's sales order.

As needed, it is possible to generate a cumulative order of the processings to be performed, even if they belong to different sales orders, or to create a single supplier order linked to a single sales order.

VG7 Dashboard

Automate the shipment management

VG7 Logistics is the perfect tool to track shipments and manage communications to and from different couriers. The use of a single platform allows you to integrate flows, save time in dealing with couriers and avoid having to use multiple management systems, thus reducing all possible human errors.

Update stocks in real time based on actual use

VG7 Logistics allows not only to check the stock available for each material involved and related orders, but also to update the stock once the processing for a specific raw material has been completed. This guarantees real-time control of the warehouse.
