# VG7 PRODUCTION

## Automatically manage each phase of the order

Thanks to the Production Routing module, you can manage each work phase and monitor all the orders in production in real time.

The system automatically identifies the processing queue for each order and assigns each phase to the operators and processing centers involved.

The module also allows you to efficiently manage tickets and critical issues, provides detailed reports on the progress of work, automatically creates transport documents and purchase orders for work and material, which are entirely customizable with company logos and data.

## It improves the entire production flow, from receipt of the order to shipment

### Thanks to the features included in the VG7 Production Routing it is possible to:

- Automatically create processing phases
- Assign phases to operators or processing centers
- Monitor and manage all processing queues
- Manage the progress of the processing phases through Barcode reading
- Manage operators and processing centers
- Manage tickets and critical issues

## Production Routing Template

This feature provides the possibility to define a custom workflow for each type of product (large or small format, publishing sector, screen printing, etc.).

Through the routing template, it is possible to assign work phases to operators or processing centers, as well as to add missing work phases and filter the template by printer, in order to assign the right workflow to each one of them.

## Time tracking and reporting

This feature allows you to track production times for each processing phase.

The time tracking can be done manually or automatically, depending on the type of work to be carried out.

Finally, the system compares the estimated times with the actual ones, providing an updated and detailed final report, regarding both the work phases and the materials used.

## Management of active and passive transport documents

It is possible to create both sales transport documents and subcontracting transport documents, depending on whether the material to be transported is semi-finished - and therefore directed to the supplier - or finished - and directed to the final customer.

The system also enables you to archive all transport documents of the passive cycle, i.e. the transport documents created by third parties, for the dispatch of external semi-finished products.

## Workload of the machines

This feature collects the machine data and uses it to logically direct the workflow, in order to optimize time.

Thus each machine receives more or less orders to carry out, based on the daily load to which it is subjected.

## Management of external processing purchase orders

This feature allows you to create subcontracting orders starting from the customer's sales order.

As needed, it is possible to generate a cumulative order of the processings to be performed, even if they belong to different sales orders, or to create a single supplier order linked to a single sales order.

VG7 Dashboard

## Supplier management

The supplier management allows you to manually create personal master data or import them from CSV files.

Each supplier can also have multiple contacts as well as multiple shipping locations.

## Production board

The production board is a full-screen dashboard, whose content can be customized according to the data to be displayed. The ideal use scenario is a large screen, accessible to the entire production department.
